CLIENT HANDOVER REPORT

# Mahabharat Consultancy Automation Workflow Report

Government application form assistance: architecture, workflow, current portal status, installation, security, test results and the client testing plan.

REPORT DATE
**29 October 2026**

PHASE
**Automation foundation — handover for client testing**

WEBSITE
**www.mahabharat.net.in**

ASSISTANT EXTENSION
**Mahabharat Consultancy Assistant, version 0.1.0 (Chrome / Edge)**

| Delivery item | Status |
|---|---|
| Automation foundation | Complete |
| Automated local regression testing (Chrome and Edge) | Passed |
| Client-side manual testing | Pending |
| GST real-page verification | Pending applicant captures and supervised trial |
| PMEGP real-page verification | Pending applicant captures and supervised trial |
| Army, Navy, Air Force and Postal GDS adapters | Pending |
| Production-enabled government adapters | None currently |

**In one sentence**

This is a completed automation foundation, prepared for client testing. Verification on the live government portals is still outstanding, so the extension does not fill any real government form today.

This report contains no applicant data, credentials, Aadhaar or PAN numbers, OTPs or secrets. Test results quoted are from automated local regression suites, not live government portal acceptance tests.

# Contents

| | | |
|---|---|---|
| A | Project overview | What the automation is and why it exists |
| B | Complete architecture | Components and how they connect |
| C | How the automation works | End-to-end workflow, step by step |
| D | What has been developed | Completed work in this phase |
| E | Portal support and current status | GST, PMEGP and the researched portals |
| F | How to install and use the extension | Client-friendly steps |
| G | Security and limitations | What is protected and what is never automated |
| H | Testing and technical verification | Reported Chrome and Edge results |
| I | Client testing and feedback | Checklist and feedback form |
| J | Current delivery status | Exact status of every deliverable |

## How to read this report

The report uses four distinct levels of evidence. They are deliberately kept separate, because passing one level does not imply the next.

| Evidence level | Meaning | Current state |
|---|---|---|
| **1. Local mock tests** | Automated tests run on this project's own test pages (a mock portal and stand-in pages rebuilt from public captures) with synthetic applicant data. | Passed |
| **2. Real-page structural evidence** | A sanitised capture of a real government form's structure (labels, control types, selectors), taken without typing anything. | Partial |
| **3. Supervised real-page filling** | The applicant watches a single, supervised fill of declared fields on the real portal page and keeps the downloaded verification record. | Not yet run |
| **4. Production-enabled adapter** | A portal adapter that has passed levels 1 to 3 and has been explicitly switched on for normal filling. | None |

# A Project overview

## What the Mahabharat Consultancy automation is

Mahabharat Consultancy runs a one-stop service centre and a customer website (**www.mahabharat.net.in**) where applicants request government and online services, upload documents, pay, and track progress. Many of these services end with someone typing the same applicant details into an official government portal.

The automation is a set of components that lets the applicant's details, already held in their Mahabharat Consultancy account, be **proposed** for matching fields on a supported government form, **reviewed and approved** by the applicant, and then **filled** into only those approved fields. Everything that requires the applicant's own identity or consent stays manual.

## Why a browser extension

- Government portals run on their own websites. The Mahabharat website cannot, and must not, reach into another site's page. A browser extension running in the applicant's own browser is the standard and safe way to assist on a page the applicant has opened themselves.
- The applicant stays in control: they open the portal, sign in themselves, complete CAPTCHA and OTP steps, and submit the application themselves.
- The extension reuses the applicant's existing website sign-in, so no password or token ever needs to be entered into, or stored by, the extension.

## How applicant information is used

Applicants maintain a reusable **Applicant Profile** on the website (personal details, contact, addresses, education, examination details and masked identity references) and supply request-specific details when they create a service request. When the extension needs values for a form, it asks the backend for one specific open request. The backend combines that request with the applicant's profile and returns only permitted, validated values. The extension holds them in memory for one preview and discards them afterwards.

## How the parts work together

### Website

Sign-in, Applicant Profile, service requests. The source of applicant information.

### Backend API

Checks who is asking and whether they may see the request, then returns read-only autofill values.

### Browser extension

Connects using the existing sign-in, lets the user pick a request, and shows the preview and approval screen.

### Shared form engine

Portal-independent logic: detects and classifies fields, maps values, builds previews, revalidates and fills.

### Portal adapters

Small, portal-specific rule files (GST, PMEGP) that tell the engine exactly which fields may be mapped.

### Portal registry

The single list of portals, their exact web addresses and their verification status. It decides whether filling is allowed.

# B Complete architecture

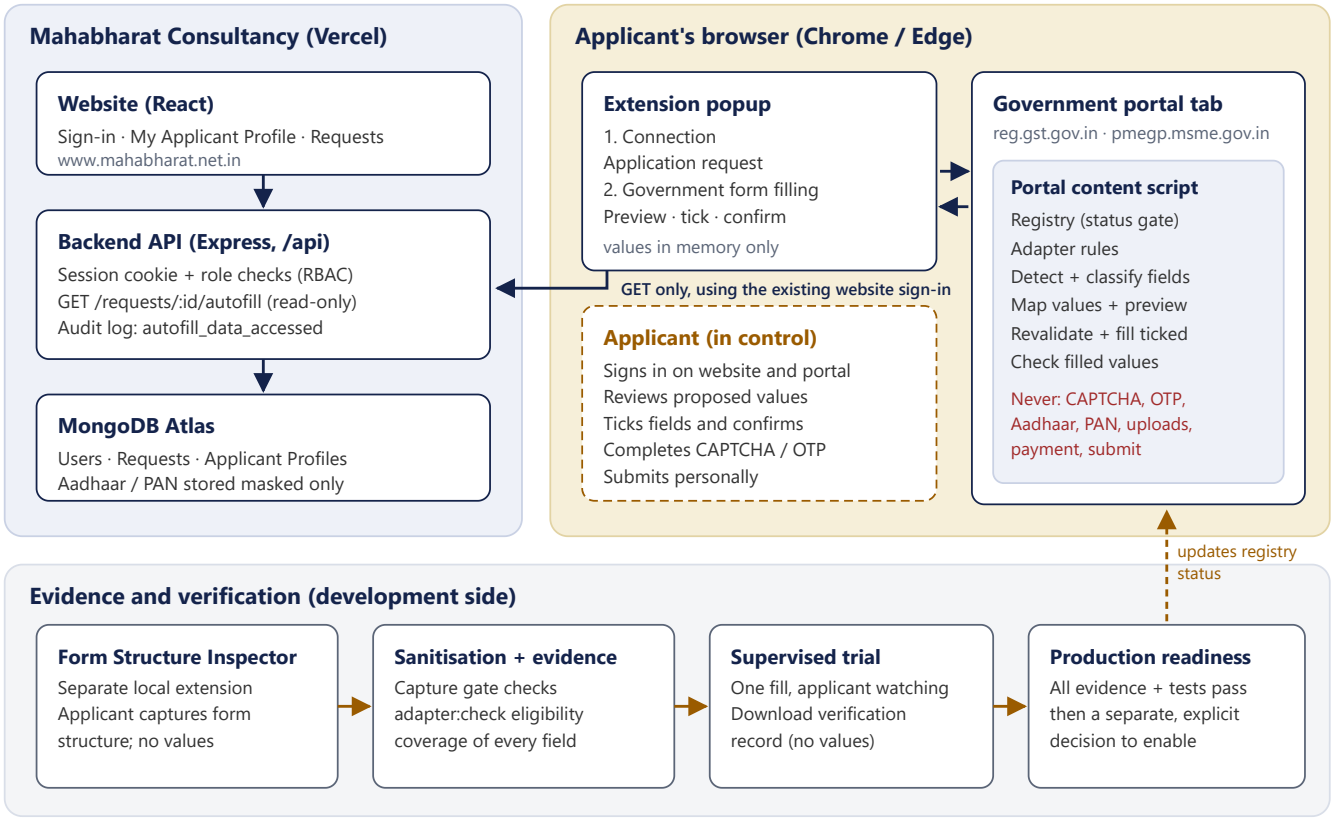

Figure 1. Components and data flow. Applicant values travel only from the backend to the popup and from the popup to the portal tab, and are never stored.

## Components

| Component | Role |
|---|---|
| **Mahabharat Consultancy website** | React application at www.mahabharat.net.in. Customers sign in, maintain **My Applicant Profile**, and create and track service requests. |
| **Applicant profile and request information** | The profile (one per customer) holds personal details, contact, permanent and correspondence addresses, education, up to five examination entries and masked identity references (last four characters only). Each request holds request-specific applicant details and its status. |
| **Authentication and authorization** | Sign-in sets an HttpOnly session cookie plus a CSRF cookie. Role-based access control separates customers, agents and admins. Profile routes are customer-only. |
| **Backend autofill API** | `GET /api/requests/:id/autofill` . Read-only. Served only for open requests, and only to the request's customer, its assigned agent or an admin. Another customer's request and a non-existent request both return the same "not found" answer. |
| **Manifest V3 browser extension** | "Mahabharat Consultancy Assistant". No extra browser permissions. It may talk only to www.mahabharat.net.in (and localhost for development), and it runs on government pages only on the exact GST and PMEGP addresses listed in its manifest. |
| **Shared automation engine** | Portal-independent modules: registry, adapter rules, classification, value formatting, preview, message protocol and guarded DOM filling. |

| Component | Role |
| --- | --- |
| **Portal-specific adapters** | GST registration (part A) and PMEGP application (new unit) adapters, version 1.0.0. They declare which selectors may be mapped and which must stay protected. They are not loaded by the extension until verification is complete. |
| **Form Structure Inspector** | A separate, local-only extension used to capture a sanitised description of a portal form after the applicant signs in themselves. It never fills or submits. |
| **Field detection and classification** | Reads each visible form control's label, type and constraints and classifies it as mappable, protected (password, CAPTCHA, OTP, declaration), identity-manual (Aadhaar, PAN), document upload or unsupported. |
| **Field mapping and preview** | Matches classified fields to applicant data keys, formats values to the field's rules, flags low-confidence, ambiguous or duplicate matches, and shows a preview. Nothing is filled at preview time. |
| **Applicant approval and supervised verification** | The applicant ticks fields and confirms before any fill. A separate supervised-trial mode exists to verify an adapter on the real page once, with a downloadable verification record. |
| **Audit and security controls** | Every successful autofill data access is recorded in the audit log (actor, role and request only, never values). Profile and applicant-detail edits are audited by section or field name only. |

# C How the automation works

The end-to-end workflow is shown below. Steps marked in gold are decisions only the applicant can make. The column on the right shows who performs each step.

1 **Applicant signs in to Mahabharat Consultancy** — Applicant
In the same Chrome or Edge browser, at www.mahabharat.net.in. The extension later reuses this sign-in.

2 **Applicant information is maintained** — Applicant
In **My Profile** (page title "My Applicant Profile", saved with **Save Profile**) and in the relevant service request. Full Aadhaar or PAN numbers are rejected; only the last four characters are accepted.

3 **Applicant opens a supported government application page** — Applicant
Currently the GST registration page (reg.gst.gov.in/registration) or the PMEGP home page (pmegp.msme.gov.in/Home/HomePage).

4 **Extension recognises the supported portal** — Extension
The portal content script runs only on those exact addresses, in the top frame, and reports the portal's registry status to the popup.

5 **Extension identifies available form fields** — Engine
Visible controls are read for label, type, length and pattern limits. Hidden, disabled and locked fields are not used.

6 **Authorised applicant information is retrieved** — Server
The popup sends one GET request for the selected open request using the existing website sign-in. The server checks ownership or assignment, returns validated values, and writes an audit entry.

7 **The engine classifies and maps eligible fields** — Engine
Only fields that the portal adapter allows are mapped. Protected and identity fields are excluded before any value is matched.

8 **Applicant reviews the proposed values** — Applicant
The preview table lists each field, the proposed value, whether it replaces something already typed, and its status. Nothing has been filled yet.

9 **Applicant selects and approves fields** — Applicant
Only fields marked ready can be ticked. The applicant must also tick the confirmation statement before the fill button is enabled.

10 **Extension revalidates the page and fills approved fields** — Engine
The preview must be fresh (5 minutes, single use). Each field is checked again just before filling (label, type, limits, visibility, lock, protection). If the page changed or reloaded, the fill is refused and a new preview is required.

11 **Extension checks the values were populated correctly** — Engine
After filling, each field is read back and reported as filled or as a problem, followed by a reminder of what the applicant must still do.

12 **Applicant completes the remaining steps personally** Applicant

CAPTCHA, OTP, Aadhaar and PAN entry, declarations, document uploads, payment and the final submission are always done by the applicant.

**The extension assists with form filling. It does not submit government applications.**

It never presses Proceed, Validate or Submit buttons, never solves CAPTCHA, never enters OTPs, and never accepts declarations on the applicant's behalf.

**Current state of steps 7 to 11 on real portals**

Normal filling is switched off for every government portal today (see Section E). On the real GST and PMEGP pages the extension completes steps 3 and 4, reports "Portal detected. Filling stays off ...", and keeps the **Preview proposed values** button disabled. Steps 7 to 11 have been exercised end to end on local test pages only.

# D What has been developed

The following items are implemented in the repository and covered by the automated tests in Section H.

| Deliverable | What it does |
|---|---|
| **Applicant profile integration** | New "My Applicant Profile" page and `GET/PUT /api/profile` (customer only, validated, audited by section). New requests offer **Fill from my profile**. |
| **Read-only authenticated autofill API** | `GET /api/requests/:id/autofill` returns each value with a status of available, missing or invalid, plus lists of missing and invalid keys. Responses are marked no-store. |
| **Request ownership and authorization** | Customer, assigned agent or admin only. Unauthorized and non-existent requests both return 404; closed requests return 409. Legacy full Aadhaar/PAN values are returned as invalid with no value. |
| **Browser extension foundation** | Manifest V3 extension with toolbar popup, trusted-origin connection, request picker and readiness check that lists fields missing from the profile or needing correction. |
| **Shared portal-independent engine** | One engine used for every portal, so a new portal needs only an adapter and evidence, not new filling code. |
| **Field classification and mapping** | Classification into mappable, protected, identity-manual, document and unsupported; confidence scoring; detection of ambiguous and duplicate matches. |
| **Preview and approval workflow** | Preview table, per-field ticks, mandatory confirmation statement, explicit fill button, **Cancel**. |
| **Guarded DOM filling** | Fills only approved, still-valid fields, and triggers the page's own input events so the portal's validation runs normally. |
| **Local Form Structure Inspector** | Separate extension, limited to listed government origins, that captures form structure without values. |
| **Capture sanitisation and evidence checks** | Captures leave out typed values, selections, hidden inputs and greetings, and are rejected if they contain applicant-like text. Evidence tools check every captured field is accounted for. |
| **GST registration adapter** | Part A adapter (v1.0.0) mapping e-mail and mobile only; PAN and legal name kept protected. |
| **PMEGP application adapter** | New-unit adapter (v1.0.0) mapping communication taluka/block, PIN, mobile and e-mail. |
| **Supervised verification workflow** | Trial mode limited to registry-declared fields, a 2-minute single-use preview, the applicant's confirmation, immediate cancellation and a downloadable record containing metadata only. |
| **Preview expiration and cancellation** | Previews expire after 5 minutes (trial: 2 minutes) and are single use. Cancelled, replaced or expired previews are dropped from the page. |
| **Page-change detection and revalidation** | Each preview is tied to the page instance; reloads or changes are detected and every field is re-checked immediately before it is filled. |
| **Security controls and audit logging** | Strict message checks between popup and page, values never stored or logged, audit entries for autofill access and profile edits. |
| **Chrome and Edge regression testing** | Nine browser smoke suites run in both Chrome and Edge, plus Node unit suites and server security and audit suites. |

# E Portal support and current status

Status is taken from the portal registry and the final technical readiness report (29 October 2026), re-confirmed with the project's `adapter:check` tool the same day. Both GST and PMEGP are registered as "Adapter written — filling off until verified on the live form".

| Portal | Mapped fields | Real-page structural evidence | Supervised trial | Normal filling |
|---|---|---|---|---|
| **GST** reg.gst.gov.in, part A | 2 | Pre-Proceed public capture exists (8 fields). **Post-Proceed capture pending.** | Not passed | Not enabled |
| **PMEGP** pmegp.msme.gov.in, new unit | 4 | Pre-Aadhaar public capture exists (98 fields). **Post-Aadhaar captures pending.** | Not passed | Not enabled |
| **Army Agniveer** | 0 | Researched only. No application form captured. | None | No adapter |
| **Navy Agniveer** | 0 | Researched only. No application form captured. | None | No adapter |
| **Air Force Agniveervayu** | 0 | Researched only. No application form captured. | None | No adapter |
| **Postal GDS** | 0 | Researched only. No application form captured. | None | No adapter |

### GST registration (part A)

- Two mapped fields: **e-mail** and **mobile**.
- PAN and legal name are protected; four other controls are unsupported.
- Remaining: an applicant-run capture after Proceed, then a supervised trial.

### PMEGP application (new unit)

- Four mapped fields: **communication taluka/block**, **PIN**, **mobile** and **e-mail**.
- 51 fields protected (Aadhaar, PAN, OTP, CAPTCHA, logins, Aadhaar-derived), 6 ambiguous, 37 unsupported.
- Remaining: applicant-run captures after Aadhaar validation, then a supervised trial.

## Army, Navy, Air Force and Postal GDS

Researched only; no implemented or verified application adapters. Each needs real application-form captures taken by an applicant who signs in themselves, and, where the form is hosted on a domain not authorised today (such as `cdn.digialm.com` or `navydmpr.in`), an explicit decision to authorise that domain. Postal GDS registration was closed when checked.

## Path to enabling a portal

1. The applicant uses the Form Structure Inspector to capture the page after their own verification step.
2. The evidence check reports the portal as eligible for a supervised trial.
3. A developer switches that portal to "supervised verification only" and loads its adapter.
4. The applicant runs the supervised trial and the verification record is saved with the project.
5. The production-readiness check and every regression test pass.
6. Normal filling is enabled by a separate, explicit decision. The automated tests refuse any step whose evidence is missing.

# F How to install and use the extension

**Before you start**

The extension is installed from the project's `extension` folder (the folder that contains `manifest.json`). It is not yet published in the Chrome Web Store or Edge Add-ons, so it is loaded in Developer mode. Updating the website does not update the extension; after receiving a new version of the folder, press **Reload** on the extension card.

## Install (one time)

1. **Open Chrome or Edge**
   Use the same browser in which you will sign in to the Mahabharat website.

2. **Open the extensions page and enable Developer mode**
   Chrome: go to `chrome://extensions` and switch on **Developer mode** (top right). Edge: go to `edge://extensions` and switch on **Developer mode** (left panel).

3. **Load unpacked**
   Click **Load unpacked** and select the `extension` folder. The card "Mahabharat Consultancy Assistant 0.1.0" appears. Pin it from the browser's extensions (puzzle) menu for easy access.

## Use

4. **Sign in to the Mahabharat Consultancy website**
   At www.mahabharat.net.in in this browser. Open the extension popup: under **1. Connection** the Server is "Mahabharat Consultancy (https://www.mahabharat.net.in)" and the status reads "Connected as <name> (<role>)". If it reads "Not signed in", use **Open Mahabharat sign-in**. Never type a password into the popup.

5. **Open an eligible applicant request**
   Under **Application request**, choose from **Open requests** (or paste a 24-character request ID) and press **Check autofill readiness**. The popup shows how many values are available, missing or need correction, and lists them under "Missing in applicant profile" and "Needs correction". Fix gaps in **My Profile** on the website.

6. **Navigate to a supported government portal**
   Open the GST registration page or the PMEGP home page in a tab, then open the popup on that tab.

7. **Recognise the portal and inspect the page status**
   Under **2. Government form filling** the popup shows Portal, Verification and Form. Today it reports "Portal detected. Filling stays off ..." for GST and PMEGP, because neither adapter is verified yet.

8. **Review the proposed field mappings**
   *Available only on a portal verified for normal filling (none today).* Press **Preview proposed values**. The table shows Fill, Field, Proposed value and Status for each field. Nothing is filled yet.

9 **Select and approve the eligible fields**
Untick anything you do not want filled. Tick "I reviewed these values. Fill only the ticked fields. I will complete CAPTCHA, OTP, declarations, uploads, payment and final submission myself."

10 **Confirm filling**
Press **Fill selected fields**, or **Cancel** to discard the preview. If more than 5 minutes pass, or the page changes, preview again.

11 **Verify the populated values manually**
Read the result summary in the popup and check every filled field on the portal page yourself.

12 **Complete the remaining government steps personally**
CAPTCHA, OTP, Aadhaar and PAN, declarations, uploads, payment and final submission.

**Supervised verification trial (used once per portal, with the developer)**

When a portal is switched to supervised verification, the popup shows a "Supervised verification trial" panel with **Start supervised trial**, a confirmation box, **Fill ticked fields (trial)**, **Cancel trial** and, afterwards, **Download verification record**. This mode verifies the adapter; it is not normal filling.

**The Form Structure Inspector is a separate tool**

"Mahabharat Form Structure Inspector (local only)" lives in `extension/inspect`. It is a development and evidence tool with **Capture form structure** and **Download capture (JSON)** buttons, used only when the developer asks for a capture. It is not the client-facing assistant and it never fills or submits anything.

# G Security and limitations

## Security controls

| Control | How it is enforced |
|---|---|
| **Existing session is reused** | The extension uses the browser's own website session cookie for GET requests only. CSRF protection on all other requests is unchanged. |
| **Authorization rules apply** | Applicant data is returned only to the request's customer, its assigned agent or an admin, and only while the request is open. |
| **No password or token storage** | The extension never reads, stores or forwards a password, token or cookie. It requests no browser API permissions; it can contact only the Mahabharat website, and runs on government pages only at the exact GST and PMEGP addresses. |
| **Values are not stored or logged** | Applicant values live only in memory for one preview. They are never written to extension storage, cookies, logs or downloads. |
| **Preview is temporary** | 5-minute single-use preview (2 minutes in a supervised trial). Cancelled, replaced and expired previews are discarded from the page. |
| **Fields are revalidated before filling** | Label, type, length and pattern limits, visibility, lock and protection are re-checked immediately before each field is filled. |
| **Sensitive fields remain excluded** | Passwords, CAPTCHA, OTP, Aadhaar, PAN, declarations and uploads are classified as protected before any mapping happens, and adapters can force further fields to protected. |
| **Page messages are locked down** | Only this extension's popup is answered; every message has a strict shape, a page nonce and a version tag. Web pages cannot reach the engine. |
| **Masked identity storage** | The website and API reject full Aadhaar or PAN numbers; only the last four characters are stored, and any legacy full number is masked on the way out. |
| **Audit trail** | Successful autofill access, profile updates and applicant-detail edits are audited without recording any values. |

## Never automated

CAPTCHA · OTP · Aadhaar number · PAN number · passwords and logins · declarations and consent boxes · document uploads · payments · Proceed, Validate and Submit buttons · final submission

## Limitations and responsibilities

- **The applicant remains responsible** for reviewing every field on the government form and for submitting it.
- No government portal is enabled for normal filling today. GST and PMEGP need applicant captures and a supervised trial first.
- The extension works only in the top frame of the exact portal addresses listed. Forms inside frames, or on other domains, are not read.
- Government portals can change without notice. A changed page is detected and filling is refused, but a portal redesign will require new captures and an adapter update.
- The extension is installed in Developer mode and is not yet distributed through a browser store.

# H Testing and technical verification

Results reported in the final Milestone 7 technical report. Every suite was re-run on 29 October 2026 for this handover, with identical counts in both browsers.

**What these results do and do not show**

These are automated local regression results using local test pages and synthetic data. They show the foundation behaves as designed in Chrome and Edge. They are **not** live government portal acceptance tests, and they do not show that any real government form has been filled. The "4 pending" items are Army, Navy, Air Force and Postal GDS, which have no captures yet.

| Browser smoke suite | What it covers | Chrome | Edge |
|---|---|---|---|
| **Inspector smoke** | Form Structure Inspector capture, sanitisation and download | 70/70 | 70/70 |
| **Browser smoke** | Extension load, website connection, request picker, readiness | 27/27 | 27/27 |
| **Portal smoke** | End-to-end preview, approval, fill, expiry, cancel and page-change on the mock portal | 104/104 | 104/104 |
| **Adapter fixture** | Adapter evidence against captured fixtures | 17/17<br>4 pending | 17/17<br>4 pending |
| **GST adapter** | GST adapter rules on a stand-in built from the public capture | 46/46 | 46/46 |
| **GST page** | Behaviour of the real GST page content script with filling off | 27/27 | 27/27 |
| **PMEGP adapter** | PMEGP adapter rules on a stand-in built from the public capture | 47/47 | 47/47 |
| **PMEGP page** | Behaviour of the real PMEGP page content script with filling off | 29/29 | 29/29 |
| **Supervised smoke** | Supervised trial flow, record and refusal cases | 83/83 | 83/83 |

| Server, build and unit checks | What it covers | Result |
|---|---|---|
| **Server security regression** | Authentication, roles, cookies, CSRF, logout and access control | 27/27 |
| **Audit verification** | Profile, autofill API, authorization, masking, audit entries, backwards compatibility | 72/72 |
| **TypeScript** | Type check of the website code | Clean |
| **ESLint** | Lint of website and extension code | Clean |
| **Production build** | Vite production build of the website | Clean |
| **Extension and engine** | Node unit tests of popup logic, API client and engine | 199/199 |
| **Inspector unit** | Capture and sanitisation logic | 87/87 |
| **Evidence tests** | Capture, gate, trial and readiness evidence | 241/241, 4 pending |
| **Evidence check** | GST and PMEGP trial eligibility | Awaiting capture (expected) |

# I Client testing and feedback

Please work through the checklist with a test applicant account and non-sensitive test details. Items marked Now can be tested on the live website today. Items marked At trial become testable on a real portal once that portal reaches the supervised-trial stage; until then the developer can demonstrate them on the local test pages.

| | Area | What to check | When |
|---|---|---|---|
| ☐ | **Website login** | Customer sign-in at www.mahabharat.net.in works; sign-out works. | Now |
| ☐ | **Applicant profile** | My Profile opens, saves and reloads correctly; full Aadhaar/PAN numbers are refused; only last four characters accepted. | Now |
| ☐ | **Applicant request selection** | Open requests appear in the popup's "Open requests" list; closed requests do not. | Now |
| ☐ | **Extension connection** | Popup shows "Connected as …"; after signing out it shows "Not signed in" and offers **Open Mahabharat sign-in**. | Now |
| ☐ | **Readiness check** | **Check autofill readiness** counts and missing/needs-correction lists match the profile. | Now |
| ☐ | **Supported portal recognition** | On the GST and PMEGP pages the popup shows the portal name and "Filling stays off"; on other sites it says no supported portal was detected. | Now |
| ☐ | **Field detection** | The expected fields are detected on the form. | At trial |
| ☐ | **Correct field mapping** | Each proposed value is matched to the right field. | At trial |
| ☐ | **Preview accuracy** | Values and formats in the preview are correct; "replaces current value" appears when relevant. | At trial |
| ☐ | **Field selection and approval** | Unticked fields are not filled; the fill button stays disabled until the confirmation is ticked. | At trial |
| ☐ | **Autofill correctness** | Filled values on the page match the preview exactly. | At trial |
| ☐ | **Cancellation and expiry** | **Cancel** discards the preview; an old preview is refused and asks to preview again. | At trial |
| ☐ | **Error handling** | Messages are clear for signed-out, invalid request ID, unavailable or closed request, and network problems. | Now |
| ☐ | **Browser compatibility** | The above behaves the same in Chrome and Edge. | Now |

## Feedback form

Please record observations below (or in the same structure by e-mail or message). Do not include real Aadhaar, PAN, OTP, passwords or other applicant identity numbers in feedback. Screenshots should have personal details covered.

| Category | Portal / page, browser, what happened, what was expected |
|---|---|
| **Incorrect field mapping** | |
| **Missing fields** | |
| **Incorrect applicant data** | |
| **Portal recognition problems** | |
| **UI / UX improvements** | |
| **Browser compatibility issues** | |
| **Other workflow suggestions** | |

> **How feedback will be handled**
>
> All feedback will be collected and reviewed together before any further changes are made. Changes will then be planned, implemented and re-tested as a separate, agreed step, so that the verified foundation is not altered piecemeal.

## Applicant participation still needed

| Portal | What the applicant needs to provide |
|---|---|
| **GST** | A Form Structure Inspector capture of the page reached after the applicant presses Proceed themselves (taken before typing any OTP), then a supervised trial run while watching the page. |
| **PMEGP** | Inspector captures of the pages reached after Aadhaar validation (taken by the applicant themselves), then a supervised trial run while watching the page. |
| **Army, Navy, Air Force, Postal GDS** | Captures of the actual application forms after the applicant signs in, once applications are open, plus a decision on any additional domain that hosts the form. |

# J Current delivery status

| Item | Status |
|---|---|
| **Automation foundation** | Complete |
| **Automated local regression testing** | Passed |
| **Client-side manual testing** | Pending |
| **GST real-page verification** | Pending applicant captures and supervised trial |
| **PMEGP real-page verification** | Pending applicant captures and supervised trial |
| **Army / Navy / Air Force / Postal adapters** | Pending |
| **Production-enabled government adapters** | None currently |

**Summary**

The government portal automation is **not** complete. What has been delivered is a completed, tested automation foundation, prepared for client testing, with real-portal verification outstanding. GST and PMEGP are the next portals to verify, and both depend on applicant-run captures and a supervised trial.

## Where things are

| Item | Location |
|---|---|
| Assistant extension (load this folder) | `extension/` |
| Form Structure Inspector (developer tool) | `extension/inspect/` |
| Portal adapters and research notes | `extension/adapters/` , `extension/adapters/scaffolds/` |
| Technical readiness report | `README.md` , section "Browser extension — technical readiness report" |
| This report | `Mahabharat_Consultancy_Automation_Workflow_Report.pdf` (repository root) |
| Website | www.mahabharat.net.in, deployed automatically by Vercel from the repository's `main` branch |
